

Date	3 July 2026
Team ID	xxxxxx
Project Name	Credit Card Approval Prediction
Maximum Marks	2 Marks

Phase of Journey	Stage 1: Application Submission	Stage 2: ML Processing	Stage 3: Result Delivery
Actions	User opens the web app, navigates to the Predict page, fills in applicant details (income, age, employment, etc.) and clicks "Predict Approval"	Flask backend receives the form, validates inputs, applies preprocessing (encoding + scaling), and passes features to the trained Random Forest model	Model returns Approved/Rejected label with confidence score; result is displayed on the page and saved to session history
Touchpoint	Web browser → /predict page (HTML form with 15 input fields)	Flask route handler → preprocess_input() → model.predict()	Prediction result card with confidence bar → /history page
Customer Thought	"I hope this is easy to fill in" / "What if I enter something wrong?"	"How long will this take?"	"I want to understand why it was approved/rejected"
Customer Feeling	Curious, slightly uncertain about what to enter	Anticipatory, brief wait	Relieved (if approved) or concerned (if rejected); informed either way
Process Ownership	Frontend (templates/predict.html) + JS validation (static/js/script.js)	app.py → preprocess_input() → model.pkl	templates/predict.html result section + templates/history.html
Opportunities	Add tooltips explaining each field; add field-level validation hints	Show a loading spinner during inference	Add explanation of which factors influenced the decision (feature importance)
