Define Problem Statements :

Project: Credit Card Approval Prediction

Problem Statement Formula

"I am [Customer] / I'm trying to [Goal] / But [Obstacle] / Because [Root Cause] / Which makes me feel [Emotion]"

Problem Statements

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A bank credit analyst reviewing applications daily	Evaluate each credit card application fairly and quickly	I have to manually check hundreds of applications every day	There is no automated system to pre-screen applicants based on financial risk	Overwhelmed, exhausted, and prone to making errors
PS-2	A salaried employee applying for my first credit card	Know whether my application will be approved before I submit	I receive no feedback on my eligibility upfront	Banks do not provide instant eligibility checks — only post-submission decisions	Uncertain, anxious, and likely to apply to multiple banks unnecessarily
PS-3	A financial compliance officer	Identify high-risk applicants with poor payment history	Many applicants with past-due records still slip through manual review	Payment history data is spread across thousands of records and hard to analyse manually	Concerned about regulatory risk and portfolio quality

Problem Summary

Banks and financial institutions face a dual challenge: **operational inefficiency** in reviewing thousands of applications and **risk of human error** in identifying high-risk applicants. Applicants, on the other hand, lack transparency into their approval likelihood, leading to unnecessary rejections and frustration. This project addresses both sides of the problem by providing an automated, data-driven prediction system accessible through a web interface.
